(54) Title: INHIBITORS OF $\alpha_v\beta_3$ MEDIATED CELL ADHESION

(I)

(57) Abstract: The present invention relates to a com-
pound of formula: (I), or a pharmaceutically acceptable
salt thereof.

INHIBITORS OF $\alpha_L\beta_2$ MEDIATED CELL ADHESIONBACKGROUND OF THE INVENTIONField of the Invention

5 The present invention relates to small molecules that are potent inhibitors of $\alpha_L\beta_2$ mediated cell adhesion which could be useful for the treatment of inflammatory diseases.

Description of Related Art

10 The integrin family of proteins are heterodimeric receptors which are expressed on all cell types to mediate cell to cell binding and adhesion to extracellular matrix. The β_2 (CD18) integrin subfamily is comprised of 3 members, $\alpha_L\beta_2$ integrin (LFA-1, CD11a/CD18), $\alpha_M\beta_2$ integrin (Mac-1, CD11b/CD18), and gp 150 β_2 integrin ($\alpha_X\beta_2$ integrin, CD11c/CD18)
15 that are primarily expressed on leukocytes (Sanchez-Madrid et al., J. Exp. Med., 158, 1785-1803 (1983)). $\alpha_L\beta_2$ integrin is found mostly on T and B lymphocytes, while $\alpha_M\beta_2$ integrin is present on activated neutrophils, NK cells and some myeloid cells. The $\alpha_L\beta_2$ integrin binds intracellular adhesion
20 molecules ICAM-1, 2 and 3 found on multiple cell types such as vascular endothelial cells, dendritic cells, epithelial cells, macrophage and T lymphoblasts (Dustin et al., J. Immunology, 137, 245-254 (1986)). Recently there has been evidence presented that $\alpha_L\beta_2$ integrin binds to ICAM-4 and a novel
25 ligand expressed in brain t l ncephalin. It has been shown that the I domain of the alpha chain is the major recognition site for its ligands.

$\alpha_L\beta_2$ integrin adhesion to ICAM-1 is necessary for immune responsiveness of T-lymphocytes to antigens, lymphocyte homing and circulation, and cell emigration to sites of inflammation (Springer, Ann. Rev. Physiol., 57, 827 (1995)). A dominant
5 role of $\alpha_L\beta_2$ integrin in mediating inflammatory events is shown in several different animal models of inflammatory diseases in which antibodies to $\alpha_L\beta_2$ integrin or ICAM-1 significantly inhibit development of therapeutic end points (Rothlein et al., Kidney International, 41, 617 (1992); Iigo
10 et al., J. Immunology, 147, 4167 (1991); Bennet et al., J. Pharmacol. and Exp. Therapeutics, 280, 988 (1997)).

Also, β_2 integrin subfamily are thought to play a critical role in several types of inflammatory disease processes by interacting with ICAMs. Support for the
15 importance of β_2 integrin in mediating inflammatory responses has been demonstrated by the evidence that transendothelial migration *in vitro* is markedly inhibited by monoclonal antibodies against β_2 integrin or ICAM-1 (Smith, Can. J. Physiol. Pharmacol., 71, 76 (1993)). Furthermore, blockade of
20 $\alpha_L\beta_2$ integrin has been shown to inhibit neutrophil influx in almost every system, including skin, peritoneum, synovium, lung, kidney, and heart. As one of the primary ligands for the β_2 integrin, it would also be expected that blockade of ICAM-1 would inhibit the inflammatory response (Albelda et al., The
25 FASEB Journal, 8, 504 (1994)).

Moreover, it has been shown that antibodies against $\alpha_L\beta_2$ integrin suppress rejection after transplantation. WO 94/04188 discloses the use of monoclonal antibodies directed against $\alpha_L\beta_2$ integrin for all transplantation's, including graft vs.
30 host or host vs. graft diseases.

According to the present invention, the desired compound (I) can be prepared by the following methods:

5 Method A:

The desired compound (I) or a pharmaceutically acceptable salt thereof may be prepared by:

(1) cyclizing the compound of the formula (II):

10 wherein OG is a hydroxyl group, a protected hydroxyl group, or a resin-bound hydroxyl group, and the other symbols are the same as defined above, and

(2) converting the resulting cyclized compound into a pharmaceutically acceptable salt thereof by a conventional
15 method, if desired.

When OG is a protected hydroxyl group, the protecting group can be selected from the conventional protecting groups for a carboxyl group (i.e., C₁₋₆ alkyl group, benzyl group).

When OG is a resin-combined hydroxyl group, the resin may
20 be selected from resin polymers which are conventionally used for a solid phase peptide synthesis. Merrifield resin may be given as an example of such resin polymers.

The cyclization can be carried out in the presence of an acid or a base in a suitable solvent.

25 The acid can be selected from organic acids (i.e., p-toluenesulfonic acid, and trifluoroacetic acid) and inorganic

acids (i.e., hydrochloric acid, sulfuric acid, and nitric acid).

The base can be selected from conventional bases such as alkali metal alkoxide (e.g., NaOEt, NaOMe).

5 The solvent can be selected from any one which does not disturb the cyclization reaction, for example, CH₂Cl₂, THF, CH₃CN, DMF, alcohols (methanol, ethanol, etc.) or a mixture thereof. The reaction is carried out at a temperature of 0 °C to boiling point of the solvent, preferably at 50 °C to 100 °C.

10 The cyclization of the compound (II) can be also carried out in the presence of a condensing reagent with or without a base in a suitable solvent or without a solvent. The condensing reagent can be selected from SOCl₂ and conventional
15 condensing reagents which can be used for a peptide synthesis, for example, BOP-Cl, BOP reagent, DCC, EDC or CDI.

20 The base can be selected from an organic base (e.g., DIEA, DMAP, DBU, Et₃N), an alkali metal hydride (e.g., NaH, LiH), an alkali metal carbonate (e.g., Na₂CO₃, K₂CO₃), an alkali metal hydrogen carbonate (e.g., NaHCO₃, KHCO₃), an alkali metal amide (e.g., NaNH₂), an alkali metal alkoxide (e.g., NaOMe, KOMe), a C₁₋₆ alkyl alkali metal salt (e.g., n-BuLi, t-BuLi), an alkali metal hydroxide (e.g., NaOH, KOH), an alkaline earth metal hydroxide (e.g., Ba(OH)₂), and the like.

25 **Cell Adhesion Protocol**

Cell Adhesion - The recombinant protein ICAM-1•Fc was constructed from the 5 extracellular domains of human ICAM-1 and fusion with the constant region of human IgG. ICAM-1•Fc was purified by Protein A affinity chromatography and stored 30 in aliquots at -20°C. Immobilized ICAM-1•Fc was prepared by

170

dilution of the protein in PBS pH 7.5, transfer of 100 μ l/well to Falcon Probind III plates and overnight incubation at 4°C. Wells coated with BSA served as a measure of non specific background adhesion. Washed plates were blocked with a solution of 0.25% ovalbumin in PBS for 1 h at 37°C. HBSS washed Jurkat cells were suspended to a final concentration of 2.5×10^6 /ml in TBSg adhesion buffer (24 mM Tris pH 7.4, 0.14 M NaCl, 2.7 mM KCl, 2 mM glucose, 0.1% HSA). A 100 μ l volume of cells was added to the blocked and washed ICAM-1-Fc coated plates that contained 100 μ l of plate buffer (TBSg, 10 mM $MgCl_2$, 2% DMSO). Adhesion was for 1 h at 37°C. Non adherent cells were removed using the EL404 plate washer (BioTek Instruments; Highland Park, VT). The number of adherent cells was quantified by measuring enzymatic activity of endogenous N-acetyl-hexosaminidase using the enzyme substrate p-nitrophenol-N-acetyl-b-D-glucoseaminide, pNAG. The amount of liberated p-nitrophenol was measured by reading the optical density at 405 nm using a vertical pathway spectrophotometer to quantify cell attachment (VMAX Kinetic Microplate Reader, Molecular Devices, Menlo Park, CA). For competition studies the compounds from 100% DMSO stock solutions were diluted in plate buffer at 2-fold the required testing concentration prior to transfer to the ICAM-1-Fc coated plate and serial dilution.

25 The compound of the present invention has an IC_{50} from low nM to μ M in the Jurkat/ICAM -1 adhesion assay.
